

UK'S FIRST WASTEWATER DISCHARGE CONSENT GRANTED FOR WATER CREMATON

Following a successful study, the UK's first 'wastewater consent to discharge' has been granted for the water cremation process, the environmentally friendly alternative to flame cremation or burial. Yorkshire Water granted the consent to Leeds-based LBBC Ltd, the parent company of Resomation Ltd which is behind water cremation worldwide. Resomation wished to demonstrate the position that following the study and the resulting academic analysis, 'the issuing of a wastewater consent is now a realistic possibility.

Resomation's fifth open day was recently held on Thursday 13th February 2020 at their facility in Beechwood Street, Leeds. Around 40 industry professionals including Funeral Directors, Celebrants and Crematoria were represented across the morning and afternoon sessions.

Further dates are planned so to register your interest email: info@resomation.com

Water cremation, or resomation as it is sometimes known, works by immersing the body in a gentle solution of 95% water and 5% alkaline and heated to around 150 degrees Centigrade in a pressurised environment. After around four hours, what is left is ash from the calcium phosphate of bones and a bio-fluid.
